Subject: Hot-water Generator Concentric Fitting

ClimateMaster has discontinued the inclusion of the Hot Water Generator concentric fitting with each unit as a standard item. The intent of this fitting was to provide a convenient means to connect the hot-water generator to the tank. However, in applications where the water contains significant amounts of minerals and the water is not being softened the mineral deposits can collect and restrict the space between the inner and outer tubes of the fitting. Restrictions can render the hot-water generator inefficient, and in some cases, inoperative.

We are now recommending an alternative method of connection that will eliminate the problem described above and allow for more efficient and dependable operation of the hot-water generator. See figure 1 for the alternative method of connection.

The concentric fitting can still be used for applications or areas that do not have significant mineral content. The ClimateMaster part number is S69619804 and can be ordered as required.
