

UNIT SPECIFICATIONS

Package Terminal Air Conditioners

Friedrich 701 Series Package Terminal Air Conditioners are thru-the-wall cooling/heating systems providing decentralized air conditioning. Each system consists of four (4) sections; wallbox, outdoor louver, cooling/heating chassis, and room cabinet. Extensive laboratory tests are performed to assure satisfactory heating and cooling operation over a wide range of conditions. All models are UL listed and rated in accordance with A.R.I. Standard 310-76. Each section is designed for ease of installation and factory assembled as follows:

WALLBOX:

Wallbox construction shall be heavy gauge, galvannealed steel, painted electrostatically and baked to form a thermo-setting coating for corrosion protection. A temporary weather seal shall be provided to protect interiors until installation is complete. Gildes shall be deformed in the base to permit easy installation and/or removal of the chassis section. Base shall include a built-in pitch of not less than 1/4" for drainage to the outside. Dimensions shall be 16" high by 40-5/8" wide with provisions to match wall thickness in 1" increments. Wall box shall not form part of finished room side enclosure.

OUTDOOR LOUVER:

Architectural outdoor louver shall be constructed from extruded aluminum with a clear anodized finish. Construction shall be angled horizontal blades secured to vertical struts forming an attractive design which blends harmoniously with exterior walls. Louver shall be secured into place in the wallbox from inside the building.

COOLING/HEATING CHASSIS:

Chassis shall include a self-contained, hermetically sealed, air-cooled refrigeration system with factory installed electric heating element and unit controls.

All sheet metal parts shall be constructed from galvannealed steel, painted electrostatically and baked to form a thermo-setting coating for corrosion protection. Compressor shall be welded hermetic design with internal spring mounting and externally double isolated behind an insulated bulkhead for minimum vibration and maximum sound reduction. Compressor shall be furnished with built-in overload protection and capacitor.

Room side fan shall consist of two slow turning double inlet centrifugal blower wheels connected directly to a two speed PSC motor with built in overload protection. Motor/blower assembly shall be provided with a quick disconnect for ease of service. Outdoor fan shall consist of a centrifugal blower wheel painted for corrosion protection, connected directly to its own PSC motor provided with built-in overload protection. All blower wheels shall be statically and dynamically balanced to obtain minimum vibration. Both motors shall be provided with oilers for life extending relubrication. Positive removal of condensate shall be provided by re-evaporation on the condenser coil and discharged as vapor without drip or splash. A clear plastic condensate

line that may be inspected visually shall be provided from condensate pan to point of dispersal. A motorized fresh air damper shall be located between the indoor and outdoor sections to provide up to 25% outside air for ventilation. Evaporator and condenser coils shall utilize staggered copper tubes with aluminum fins for efficient heat transfer. All refrigerant lines shall be copper with circuiting designed for optimum performance. Refrigerant shall be controlled by a precisely designed and optimized capillary tube to provide efficient performance over a wide range of operating conditions. Complete refrigerant circuit shall be checked for leaks and factory charged with refrigerant 22. Each unit shall incorporate an automatic, COOL-ECON-CYCLE, that locks out the compressor when outdoor temperature is below 50°F. On call for cooling, the fresh air damper shall open and outdoor blower energize to force cool outdoor air into the room. Complete factory installed and wired controls shall be provided. Standard control shall contain OFF - HIGH COOL - LOW COOL - HEAT - VENT selector switch and a self-contained adjustable thermostat. Control components shall be isolated from the air stream. Various optional control sequences shall be available. Models designed for electric heating shall be provided with a factory installed and wired heating element with built-in dual protection against over-heating. Electric heat element shall be located under the evaporator coil to eliminate user contact. A washable air filter for both fresh air and return air shall be provided. Provision shall be made for easy removal and insertion of chassis as a unit. Closed-cell material shall be used to provide a positive compression seal between chassis and wall box.

ROOM CABINET:

A. ELECTRIC: Room cabinet shall consist of two sections, a front and back. Construction shall be from heavy gauge furniture steel finished in neutral baked enamel color to blend with interior. An adjustable kickplate shall be provided, cabinet front shall be removable, providing full access to the chassis. Discharge grille and hinged control door shall be extruded aluminum with polished top and shadowed interior. Grille bars shall be set on at 15° deflection angle to direct discharge air into the room away from windows and drapes. Return air shall enter thru the bottom of the chassis between the cabinet kick-plate and cabinet front to minimize air recirculation. A factory assembled electrical wiring compartment and receptacle to match chassis cord and plug shall be provided for field wiring connection to pigtail wire leads.

B. HOT WATER & STEAM: Same description as A above plus a hydronic heating coil shall be mounted to the cabinet back. A motorized zone valve shall be factory mounted to the coil with plug-in electrical connection to the chassis section. Supply and return piping shall terminate in 5/8" o.d. copper.

C. Electric and hydronic heat room cabinet selection shall be available to fit various wall depths.

Hot Water Heating Correction Factors For Variation Of:

1. Flow Rate (GPM)
2. Entering Air Temperature
3. Entering Water Temperature

Selection Sample

Basis: Model 701-14 or -17, 1.7 GPM, 190°F Entering Water, 60°F Entering Air Temperature

1. Enter Curve No. 1 At 1.7 GPM.
2. Move Vertically To Line Marked 701-14-17.
3. Move Horizontally To Left And Read 15,600 BTU/HR Heating Capacity.
4. Enter Curve No. 2 At 190°F Entering Water Temperature.
5. Move Horizontally To Right Line Marked 60°F Entering Air Temperature.
6. Move Downward And Read Correction Factor .99.
7. Corrected Capacity = 15600 x .99 = 15345 BTU/HR.

Steam Heating Correction Factor For Variation Of:

1. Steam Pressure, PSIG
2. Entering Air Temperature

Selection Sample

Basis: Model 701-07, -09, -12 1.5 PSIG Steam Pressure 70°F Entering Air Temperature

1. From Performance Data, Determine Standard Rating Capacity Of 17000 BTU/HR.
2. Enter Curve No. 3 At 1.5 PSIG Steam Pressure.
3. Move Horizontally To Right And Meet Reference Line Marked 70°F Entering Air Temperature.
4. Move Downward, Read Correction Factor of .99.
5. Corrected Capacity = 17000 x .99 = 16830 BTU/HR.

Installation Applications

Wall Construction Greater than 10" Depth

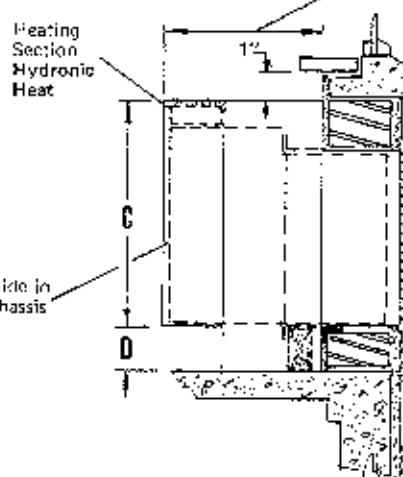

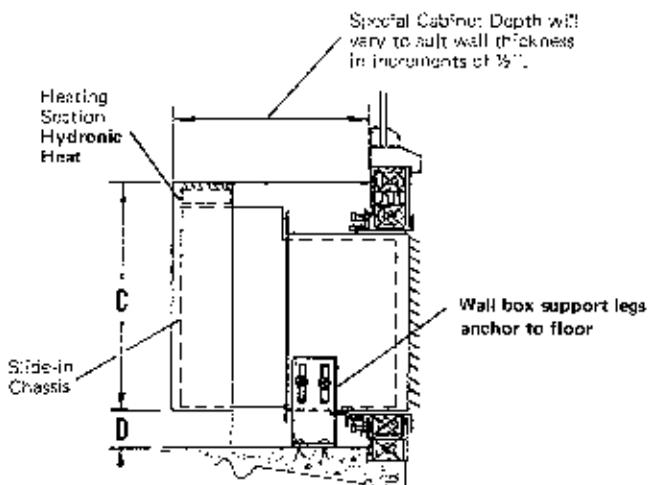

Wall Construction standard 10" Depth

Wall boxes are available in 1" increments 11" through 15". Splitters shipped with wall sleeve.

Wall Construction 9" to 5" Depth

Wall Construction with panel walls

Wall boxes should be parged to masonry and lapped to prevent movement. If the wall construction is 5" to 9" in depth a blocking beneath the box should be considered.
